

The full game is now available for free download [here](#).

Welcome to estARteco: the augmented reality free game that will help you to appreciate the value of ecosystems and their complex balance. The game has been developed by the [Virtual and Augmented Reality area of ITCL](#)

The game is divided in 4 levels of increasing difficulty. In each one you will have to balance ecological health and those environmental factors that form the environment, bearing in mind the social and economic impact that your actions may cause.

Your actions will shape the three different environments that constitute the game: a city, a forest area and a seaside village. You will realize how rivers are more or less polluted, how emissions increase or decrease, how traffic is optimized... along with many more surprises.

Be the fastest one in balancing ecosystems, answer the test questions correctly and you will be the best.

estARteco is a game, a didactic resource and augmented reality, all in one.

Try the free online [demo here](#).
